

GAIUS

Adaptive AI Technical Interview Platform

ABOUT THE PROJECT

GAIUS is a full-stack platform that simulates rigorous FAANG-style technical interviews using asynchronous LLM multi-agents and real-time WebSockets. Every session is graded on 7 evidence-bound dimensions — each score anchored to a verified transcript quote, never a guess. Paired with every report is Hermes, a RAG-powered AI mentor grounded in ChromaDB, which reads a candidate's own interview history to deliver personalized, targeted coaching. Built on FastAPI, SQLAlchemy, ChromaDB and Hugging Face inference, GAIUS closes the loop from live practice to measurable improvement.
